

excretion/Index.mjs

The flow switches from HTTP to asynchronous messaging:

```
1 Main Lambda
2   ↓
3 SNS
4   ↓
5 SQS
6   ↓
7 Excursion Lambda
```

Your earlier project notes correctly describe this second Lambda as being driven by SQS rather than API Gateway.

This is again the Lambda entry point.

Its purpose is identical to the first `index.mjs`:

Receive the AWS event and hand it to the controller.

But this time the event isn't:

```
1 API Gateway HTTP request
```

It's:

```
1 SQS event
```

The event contains:

```
1 event.Records
```

because SQS can send records to the Lambda.

So:

```
1 SQS
2   ↓
3 excursion index.mjs
4   ↓
5 excursionController.mjs
```
