

4.6 Roadmap, fix the docs, and write your retro

Why this matters

Two things close out the programme: knowing where we're going, and leaving the trail better than you found it for whoever comes next.

Do

1. *The roadmap*

Session with your manager on what we're building over the next few months and where your work fits into it. Now that you've built a compliance module yourself, this should land a lot better than it would have on day one.

2. *Fix the documentation*

Go back through every Confluence page you used during these four weeks and fix what was wrong, out of date, or missing. Add the things you had to work out for yourself. That includes:

- The Quick Setup Guide and Encon Workspace Setup pages
- The glossary in the handbook — add any term you had to go and ask about
- The Cold Chain Log brief itself — if anything in it was ambiguous or wrong, fix it for the next person

This is not optional politeness. Everyone before you was asked to do this, and the gaps you hit are the ones they didn't fill.

3. *Write a retro*

Use the retro section at the bottom of the worksheet. Short and honest:

- What was confusing or badly explained?
- What was missing entirely?
- What took much longer than it should have, and why?
- Was the Cold Chain Log a good project to learn on? What would have made it better?
- What would you change about this programme?

Blunt is more useful than polite here. Vague feedback changes nothing.

4. *Tidy up*

{{terraform destroy}} your project's AWS resources unless your manager wants them kept for reference. They cost money while they exist.

Done when

- The roadmap session has happened
- The Confluence pages you used are updated
- Your retro is written and shared with your manager
- Your AWS resources are either torn down or deliberately kept

And then

That's the programme done. Ticket 4.7 is your bridge onto the real codebase, whenever your access lands.
