

4.7 When your access lands: the real codebase and your first ticket

- Access to our repositories and to Claude Code is granted deliberately, once you're through the bulk of the programme. Everything before this ticket is designed to work without it, so don't treat this as blocked — just leave it until you're told.

Why this matters

You've built a small system of your own and you've had the architecture explained to you. This is where you actually get into the real code and ship something.

Part 1 — Get set up

- Clone `{{encon-group/encon-workspace}}`
- Run `{{./init.sh}}`
- Read the `{{CLAUDE.md}}` at the root. What are the projects inside, and what does each do?
- Install Claude Code and set up `ccstatusline`

Follow *Encon Workspace Setup* in Confluence (SE space, under On Boarding). Fix anything on that page that turns out to be wrong.

Part 2 — The code walkthrough

Now do the hands-on version of the session you had in 4.5, in the code this time. Allow around 90 minutes with the tech lead across `{{encon-nms-backend}}` and `{{encon-nms-ui}}`:

- Follow one real feature from the UI component down to the database write and back
- Where the Lambdas live and how they're structured
- Where the Terraform lives and how it's organised
- Where the tests are, and what's actually covered
- How a release happens

Skim both repos before the session. A walkthrough where you've read nothing is worth much less.

Part 3 — Your first real ticket

- Pick one up. It'll be small on purpose
- Take it the whole way: branch, code, tests, pull request, review, staging
- Use the Definition of Done you learned in 1.6 — don't invent your own

- Expect review comments. That's the process working, not a problem

Done when

- The workspace runs on your machine and Claude Code works from it
- You can trace one real feature end to end, and that trace is written into the worksheet
- Your first ticket is merged and on staging

Stuck?

Compare everything to your own project. "We did X in the Cold Chain Log — why is it different here?" is a genuinely good question, and sometimes the answer is that the real code should change.
